USE CASE DIAGRAM

18 use cases (UC-01 to UC-18) of the TurbineH invoicing and collections system. The overview shows the whole system in one diagram: every actor, every use case and every relationship. Views 1 to 4 split the same model by business area so it can be read in detail; each use case appears in exactly one view, and relationships between use cases of different views appear in the overview. The contracts in the Use Case Specification define each flow.

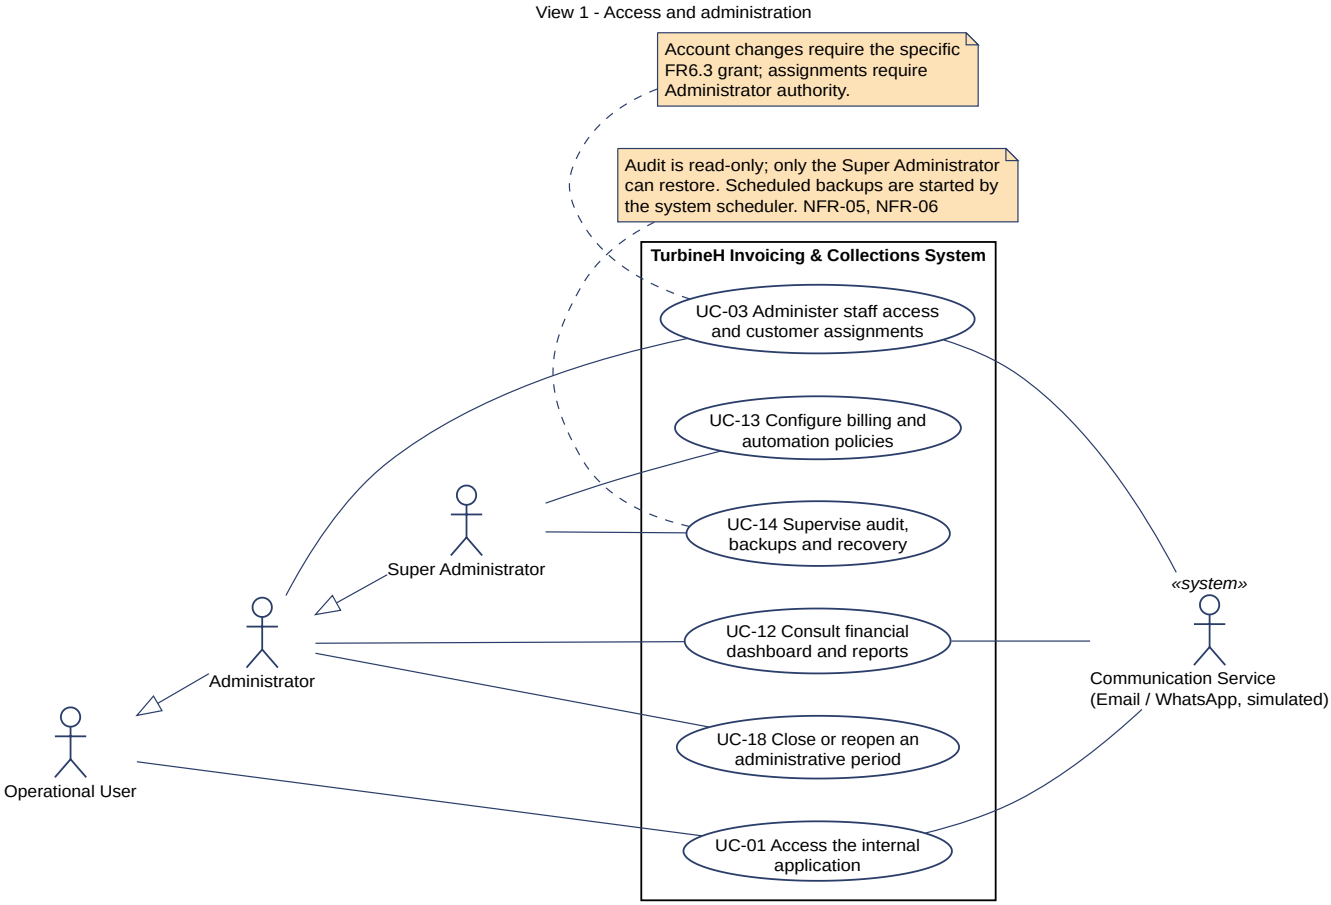

Notation

- Actor–use case associations are undirected solid lines.
- Administrator specialises Operational User, and Super Administrator specialises Administrator, so each inherits the associations of its parent. An actor is linked only to the use cases its parent does not already reach.
- <<include>> points to the included use case; <<extend>> points to the base use case and is labelled with its condition.
- Scheduled jobs (monthly invoices UC-06, reminders UC-08, scheduled payment queries, reports and backups) are system behaviour started by the system scheduler under the UC-13 policies. Time is not an actor.
